Second-year CS & Entrepreneurship student building software independently since 2022 with ~1,500 GitHub contributions across 60+ repositories; five years full-time in crypto markets and Web3.
Looking for a part-time student software engineering role; available 2–3 days a week.

EDUCATION

Reichman University | B.Sc. Computer Science & B.A. Entrepreneurship
Overall GPA: 89.4/100 | Started October 2025 | Expected graduation: July 2028

The Odin Project | Full-Stack Development Oct 2022 – Sep 2023
A year of full-time self study: JavaScript, React, Node/Express, MongoDB, TDD; shipped 30+ deployed projects, preceded by freeCodeCamp's Solidity/Hardhat course.

SELECTED PROJECTS

Unfiltered | Creator | Natural-language product search July 2026 – Present

- Built a platform-independent engine that turns natural-language requests into ranked products, with catalog ingestion, text/image enrichment and conversational refinement.
- Combined schema-validated LLM intent, hybrid vector/keyword retrieval and SQL constraints with model fallbacks and cost metering; built a bilingual evaluation suite with 98 regression cases.
- Reduced AI search **p95 latency by ~70%** on warm bilingual benchmarks (200 requests per run) by overlapping pipeline stages and hedging slow model calls.

  Stack: TypeScript, Node.js, React Router, PostgreSQL, Prisma, Gemini API, Docker, GitHub Actions, Vitest, Playwright

yoyo-loop | Creator | Multi-agent development system July 2026 – Present

- Built an autonomous system that turns Linear specifications into code and independent agent review in isolated Git worktrees; tied review verdicts to the exact commit and CI results.
- Added command guards, bounded repair cycles, stall detection and Slack alerts. Used the system to deliver **44 merged PRs across 18 issues in four days**, retaining human approval before merges.

  Stack: Claude Code skills, Bash, Git worktrees, Linear API, GitHub CLI and Actions, Slack webhooks

Prompt Racers | Creator | Educational 3D kart racing game (play) Aug 2026

- Directed multi-agent build waves to create a complete Three.js racer: drift boosts, seven AI opponents sharing the player's physics, item boxes and a prompt-building progression system.
- Shipped procedural graphics, synthesized audio and gameplay in one self-contained HTML file with zero runtime network calls; verified offline execution and added gameplay and layout tests.

  Stack: JavaScript, Three.js, Web Audio API, procedural generation, Node.js test harness (Puppeteer)

EXPERIENCE

Independent Software Developer Aug 2022 – Present

Built full-stack applications, bots and custom automations including:

- A React/Node.js/MongoDB community admissions system with X (Twitter) OAuth, Discord integration for a member voting system and admin control dashboard.
- A crypto sentiment dashboard with BullMQ/Redis workers, Gemini scoring and trend aggregation.
- A Telegram room-availability monitor that secured a last-minute Passover stay.
- A Discord bot for communities that aggregates wallet-level buys, sells, fees, and current holdings into realized and unrealized P&L reports, with token/NFT support across EVM chains, Solana, and Bitcoin.

Independent Crypto Research, Trading & Project Advisory Jul 2021 – Present

- Five years across trading, on-chain research and communities in Bitcoin, Ethereum, Solana and other ecosystems; advised early-stage projects on launch strategy and community positioning.

MILITARY SERVICE

Israel Defense Forces | Unit 636, Field Intelligence Corps Oct 2019 – Jul 2022
Personnel assignment in Meitav; later appealed my medical profile to volunteer for combat service.

TECHNICAL SKILLS

Programming: TypeScript, JavaScript, Bash, Java, C, data structures, HTML/CSS, Python (basic)
Web & data: React, Node.js, Express, REST, OAuth, PostgreSQL, pgvector, MongoDB, Prisma
AI & tools: LLM APIs, MCPs, embeddings, agent orchestration, Claude Code, Codex, Cursor, Git, Linux, GitHub Actions, Docker, Vitest, Playwright, Jest
